DETAILED ACTION

Allowable Subject Matter

1. Claims 26, 27, 32-38, and 41-46 allowed.
2. The following is an examiner's statement of reasons for allowance:

The prior art fails to teach or reasonably suggest, along with ALL other claimed limitations, the vehicular vision system, comprising: namely the light source is configured to operate in *synchronous relationship* with the acquisition of images from said image sensor, and a *means for distinguishing* reflections from self-luminous objects.

It is noted that applicant has invoked 35 U.S.C. 112 sixth paragraph, in the means for distinguishing reflections from self-luminous objects. As such examiner would like to point to ¶0051 of the Specification to find the corresponding structure used for the interpretation of this claim.

“LED illuminators may be pulsed according to a predetermined pattern indicating a code that may be unique for each device. The image may be sampled at a rate such that the code can be recognized by the control system. In this way, reflected light from the LEDs could be distinguished from all other light sourced according to the coded pulses... Also, visible light sources, such as visible LED headlights may be pulsed according to a pattern or code in the same way to distinguish reflections from self-luminous objects.”

Thus, by sampling the image at a rate that can recognize the code of the pulsed light source, be it visible or non-visible, the system is able to distinguish reflections from self-luminous objects.

Stettner US 2002/0117340 A1 (*Stettner*) teaches a laser radar based collision avoidance system for stationary objects, which transmits laser pulses to surrounding objects and collects the data to produce a three-dimensional time dependent object representation. However, the detecting of the claimed invention is done on a continuous basis, whereas the vision system of

Art Unit: 2884

the claimed invention samples the image “at a rate such that the code can be recognized by the control system.”

Nagao et al US 2003/0043280 A1 (*Nagao*) teaches a image pickup system for the area surrounding a vehicle which uses an infrared light source to illuminate obstacles and detects the infrared light reflected by the obstacles. Furthermore Nagao teaches distinguishing between the driver’s vehicle and an oncoming vehicle with such a system, by have an additional infrared light sensor 5 that sends a signal to the shutter control circuit to terminate the infrared camera (¶0043). This differs from the present claimed invention which uses predetermined pattern emitted by the light source, and synched with the acquisition of images by the image sensor, that is unique for each device; thus distinguishing reflections from self-luminous objects, such as cars with a similar system.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled “Comments on Statement of Reasons for Allowance.”
